

Abstract Internship OMV Austria E&P GmbH

During the course of my studies I partook in an internship at a subdivision of OMV AG, namely the Austrian branch of Exploration and Production in the Portfolio and Planning department of the branch. The main focus of the internship was on two projects Go 400 and Energize, with additional tasks besides the main two projects, which were in reporting, data evaluation and consolidation, and HSSE to name a few. The first main project of the internship was consisted of numerous sub projects, which aimed at increasing long term oil and gas production for the enterprise, by employing new exploration, fastening the pace of exploration and obtaining new wells and improving of mechanical components in the production line. Energize was focused on long term stabilization and decreasing natural decline in oil and gas production, mainly through improving the performance in the production line and increasing efficiency of production. Since both projects were set as multi-year only partial results were obtained during the duration of the internship, although in the case of Energize, quite a few projects were already closed, some were still running. During the duration of the internship, the subprojects were constantly updated with newest data, and the data obtained was consolidated and reported throughout the internship.
